BIZDATA

eZintegrations™

Connect Any System

About Bizdata Inc.

We help organizations with system integration and advanced data analytics providing end-to-end visibility into the business processes and easy access to critical business data in a fraction of the time of traditional means.

It offers two cloud-native, SaaS (Software as a service) based platforms

a) **eZintegrations:** A low-code, integration platform that can integrate any system, database, application and conversation in your enterprise.

b) **Bizintel360:** A low-code advanced data analytics platform that can collect data from any source, store it in data lake and visualize the data seamlessly.

What is eZintegrations?

eZintegrations is a low code, browser-based cloud Integration Platform as a Service (iPaaS) for connecting any business across hybrid and complex IT environment. Easy to use, eZintegration connects data from fragmented sources and empowers organizations to consolidate multiple cloud solutions into a single platform.

The system can be traditional RDBMS, NoSQL, Cloud Databases, Datawarehouse , Datalake, REST API, SOAP API or logs, videos, voice notes or stats from Linux commands and various protocols from IoT sensors.

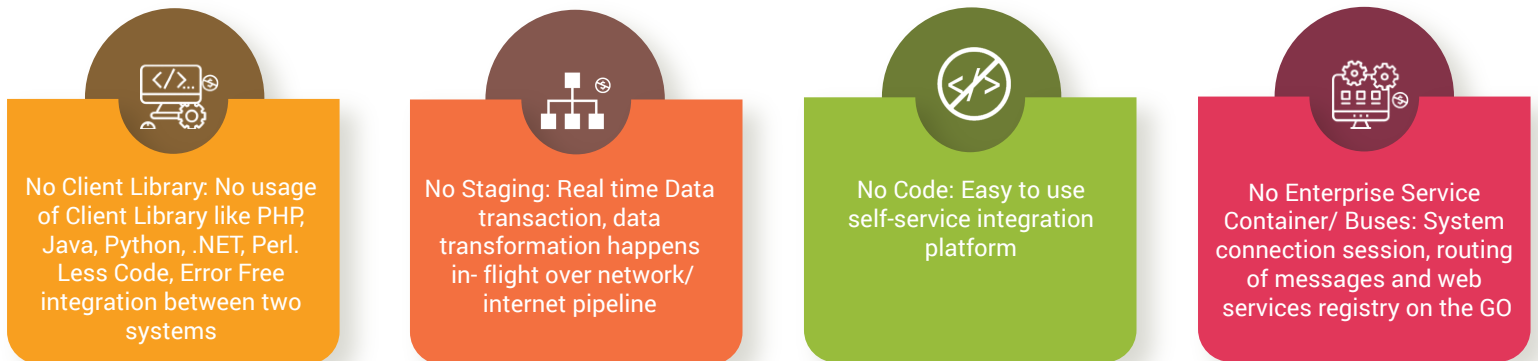

How does it work?

eZintegrations makes data available where it is needed the most. A business user can simply map attributes between objects of data Source and the Target. Schedule the frequency of data transfers, either in batch mode or in real-time, monitor and get alerts on the success and failures of data transfers on a dashboard powered by an in-built search engine. Empower your IT and Business teams on a single platform.

.

eZintegrations pipelines are configured in **3 simple steps** :

Define Data Source
Select and define data source credentials or upload files

Define Data Targets
Select and define data target credentials or define location

Create Integration Bridge
Map the attributes over a visual mapping. Stream data between two systems over a pipeline
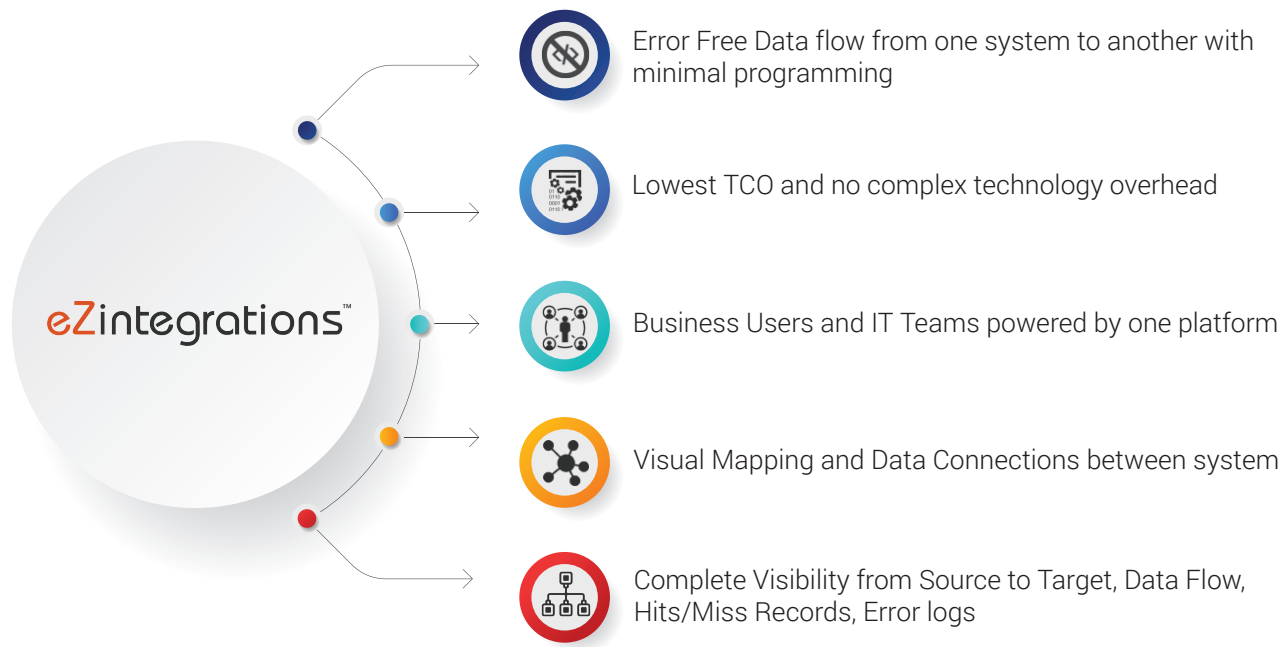

eZintegrations allows you to establish a connected enterprise ecosystem for any business across hybrid and complex IT environment.

It is a unique platform that simplifies system integration.

No Client Library: No usage of Client Library like PHP, Java, Python, .NET, Perl. Less Code, Error Free integration between two systems

No Staging: Real time Data transaction, data transformation happens in- flight over network/ internet pipeline

No Code: Easy to use self-service integration platform

No Enterprise Service Container/ Buses: System connection session, routing of messages and web services registry on the GO

Why do we need eZintegrations?

Error Free Data flow from one system to another with minimal programming

Lowest TCO and no complex technology overhead

Business Users and IT Teams powered by one platform

Visual Mapping and Data Connections between system

Complete Visibility from Source to Target, Data Flow, Hits/Miss Records, Error logs

eZintegrations Platform Use Cases

● **Connect Cloud and On-Premise Enterprise Applications**
Simplify management, governance, and integration of cloud-based and on-premise applications. Connect cloud applications and services, and control integration flows on a centralized dashboard.

● **Master Data Management**
Connect and manage master data of customers, suppliers, items, and assets directly from your MDM application. Enhance your items and assets with GTIN, URN, EIDR, UUID, UDI, or any other identifier.

● **B2B/ EDI Exchange**
Connect your business with your extended partners and 3 PL, and transact data efficiently with full compliance and complete security.

● **SaaS Applications**
Automate data transactions, notifications, workflows and Robotic Process Automation (RPA) flows with SaaS applications customized for small and large enterprises.

● **Data Warehouse**
Connect and get data in real-time from Digital Marketing Platforms, Social, SaaS, and Enterprise Data Sources to Enterprise Data Warehouse.

eZintegrations from Bizdata,Inc helps users to integrate SaaS and On-Prem applications: ERP, SCM, Customer Service, PLM, Social, Mobile, Data Warehouse, MDM, EDI and IoT sensor data.

Drag and Drop Business Object Mapping between business objects for integration at attribute/ fields level.

Application security through Roles and Privileges to align with company/ department roles.

Data transformation, Data Orchestration and Data Cleansing occurs in-flight without any need for staging

eZintegrations™
Features

Accomplish integration between systems/ applications with no code or low code and can be used by semi-technical users.

Designed for high volume data transfer workloads for structured and unstructured data sources

Dashboards and Reports for Real-time monitoring of data transportation between two systems

Provides robust data security through point to point data encryption during data at rest, data in flight and storage.
